		s for Aquatic Plants	WISCONN DEFT. OF NATURAL RESOURCES	
				Draft updated Oct 2000
Option	Permit	How it Works	PROS	CONS
	Needed?			
No Management	Ν	Do not actively manage plants	Minimizing disturbance can protect native species that provide habitat for aquatic fauna; protecting natives may limit spread of invasive species; aquatic plants reduce shoreline erosion and may improve water clarity	May allow small population of invasive plant to become larger, more difficult to control later
			No immediate financial cost	Excessive plant growth can hamper navigation and recreational lake use
			No system disturbance	May require modification of lake users' behavior and perception
			No unintended effects of chemicals	
			Permit not required	
Mechanical Control	May be required under NR 109	Plants reduced by mechanical means	Flexible control	Must be repeated, often more than once per season
		Wide range of techniques, from manual to highly mechanized	Can balance habitat and recreational needs	Can suspend sediments and increase turbidity and nutrient release
a. Handpulling/Manual raking	Y/N	SCUBA divers or snorkelers remove plants by hand or plants are removed with a rake	Little to no damage done to lake or to native plant species	Very labor intensive
		Works best in soft sediments	Can be highly selective	Needs to be carefully monitored
			Can be done by shoreline property owners without permits within an area <30 ft wide OR where selectively removing exotics	Roots, runners, and even fragments of some species, particularly Eurasian watermilfoil (EWM) will start new plants, so all of plant must be removed
			Can be very effective at removing problem plants, particularly following early detection of an invasive exotic species	Small-scale control only

		Management Options for Aquatic Plants				
				Draft updated Oct 200		
Option	Permit	How it Works	PROS	CONS		
	Needed?					
b. Harvesting	Y	Plants are "mowed" at depths of 2-5 ft, collected with a conveyor and off-loaded onto shore	Immediate results	Not selective in species removed		
		Harvest invasives only if invasive is already present throughout the lake	EWM removed before it has the opportunity to autofragment, which may create more fragments than created by harvesting	Fragments of vegetation can re-root		
			Minimal impact to lake ecology	Can remove some small fish and reptiles from lake		
			Harvested lanes through dense weed beds can increase growth and survival of some fish	Initial cost of harvester expensive		
			Can remove some nutrients from lake			
Biological Control	Y	Living organisms (e.g. insects or fungi) eat or infect plants	Self-sustaining; organism will over-winter, resume eating its host the next year	Effectiveness will vary as control agent's population fluctates		
			Lowers density of problem plant to allow growth of natives	Provides moderate control - complete contro unlikely		
				Control response may be slow		
				Must have enough control agent to be effective		
a. Weevils on EWM	Y	Native weevil prefers EWM to other native water-milfoil	Native to Wisconsin: weevil cannot "escape" and become a problem	Need to stock large numbers, even if some already present		
			Selective control of target species	Need good habitat for overwintering on shore (leaf litter) associated with undeveloped shorelines		
			Longer-term control with limited management	Bluegill populations decrease densities through predation		

			Management Option	MSCONAN DEPT. OF NATURAL RESOURCES	
	Option	Permit Needed?	How it Works	PROS	Draft updated Oct 200 CONS
b.	Pathogens	Y	Fungal/bacterial/viral pathogen introduced to target species to induce mortalitiy	May be species specific	Largely experimental; effectiveness and longevity unknown
				May provide long-term control	Possible side effects not understood
				Few dangers to humans or animals	
C.	Allelopathy	Y	Aquatic plants release chemical compounds that inhibit other plants from growing	May provide long-term, maintenance-free control	Initial transplanting slow and labor-intensive
				Spikerushes (<i>Eleocharis</i> spp.) appear to inhibit Eurasian watermilfoil growth	Spikerushes native to WI, and have not effectively limited EWM growth
					Wave action along shore makes it difficult to establish plants; plants will not grow in deep or turbid water
d.	Planting native plants	Y	Diverse native plant community established to repel invasive species	Native plants provide food and habitat for aquatic fauna	Initial transplanting slow and labor-intensive
				Diverse native community may be "resistant" to invasive species	Nuisance invasive plants may outcompete plantings
				Supplements removal techniques	Largely experimental; few well-documented cases
					If transplants from external sources (anothe lake or nursury), may include additional invasive species or "hitchhikers"

			Management Options for Aquatic Plants			
	Option	Permit Needed?	How it Works	PROS	CONS	
Ph	ysical Control	Required under Ch. 30 / NR 107	Plants are reduced by altering variables that affect growth, such as water depth or light levels			
a.	Fabrics/ Bottom Barriers	Y	Prevents light from getting to lake bottom	Reduces turbidity in soft-substrate areas	Eliminates all plants, including native plants important for a healthy lake ecosystem	
				Useful for small areas	May inhibit spawning by some fish	
					Need maintenance or will become covered in sediment and ineffective	
					Gas accumulation under blankets can cause them to dislodge from the bottom	
					Affects benthic invertebrates	
					Anaerobic environment forms that can release excessive nutrients from sediment	
b.	Drawdown	Y, May require Environmental Assessment	Lake water lowered with siphon or water level control device; plants killed when sediment dries, compacts or freezes	Winter drawdown can be effective at restoration, provided drying and freezing occur. Sediment compaction is possible over winter	Plants with large seed bank or propagules that survive drawdown may become more abundant upon refilling	
			Season or duration of drawdown can change effects	 Summer drawdown can restore large portions of shoreline and shallow areas as well as provide sediment compaction 	May impact attached wetlands and shallow wells near shore	
				Emergent plant species often rebound near shore providing fish and wildlife habitat, sediment stabilization, and increased water quality	Species growing in deep water (e.g. EWM) that survive may increase, particularly if desirable native species are reduced	
				Success demonstrated for reducing EWM, variable success for curly-leaf pondweed (CLP)	Can affect fish, particularly in shallow lakes if oxygen levels drop or if water levels are not restored before spring spawning	
				Restores natural water fluctuation important for all aquatic ecosystems	Winter drawdawn must start in early fall or will kill hibernating reptiles and amphibians	
					Navigation and use of lake is limited during drawdown	

Management Options for Aquatic Plants

					Draft updated Oct 2006	
(Option	Permit Needed?	How it Works	PROS	CONS	
c. Dredg	ing	Y	Plants are removed along with sediment	Increases water depth	Severe impact on lake ecosystem	
			Most effective when soft sediments overlay harder substrate	Removes nutrient rich sediments	Increases turbidity and releases nutrients	
			For extremely impacted systems	Removes soft bottom sediments that may have high oxygen demand	Exposed sediments may be recolonized by invasive species	
			Extensive planning required		Sediment testing may be necessary	
					Removes benthic organisms	
					Dredged materials must be disposed of	
d. Dyes		Y	Colors water, reducing light and reducing plant and algal growth	Impairs plant growth without increasing turbidity	Appropriate for very small water bodies	
				Usually non-toxic, degrades naturally over a few weeks	Should not be used in pond or lake with outflow	
					Impairs aesthetics	
					Effects to microscopic organisms unknown	
e. Non-p contro	oint source nutrient ol	Ν	Runoff of nutrients from the watershed are reduced (e.g. by controlling construction erosion or reducing fertilizer use) thereby providing fewer nutrients available for plant growth	Attempts to correct source of problem, not treat symptoms	Results can take years to be evident due to internal recycling of already-present lake nutrients	
				Could improve water clarity and reduce occurrences of algal blooms	Requires landowner cooperation and regulation	
				Native plants may be able to better compete with invasive species in low-nutrient conditions	Improved water clarity may increase plant growth	
				with invasive species in low-nutrient conditions	growth	

Management Options for Aquatic Plants				WISCOURSIN CEPT. OF NATURAL RESOURCES
				Draft updated Oct 2006
Option	Permit	How it Works	PROS	CONS
	Needed?			
Chemical Control	Y, Required under NR 107	Granules or liquid chemicals kill plants or cease plant growth; some chemicals used primarily for algae	Some flexibility for different situations	Possible toxicity to aquatic animals or humans, especially applicators
		Results usually within 10 days of treatment, but repeat treatments usually needed	Some can be selective if applied correctly	May kill desirable plant species, e.g. native water-milfoil or native pondweeds; maintaining healthy native plants important for lake ecology and minimizing spread of invasives
		Chemicals must be used in accordance with label guidelines and restrictions	Can be used for restoration activities	Treatment set-back requirements from potable water sources and/or drinking water use restrictions after application, usually based on concentration
				May cause severe drop in dissolved oxygen causing fish kill, depends on plant biomass killed, temperatures and lake size and shape
				Often controversial
a. 2,4-D	Y	Systemic ¹ herbicide selective to broadleaf ² plants that inhibits cell division in new tissue	Moderately to highly effective, especially on EWM	May cause oxygen depletion after plants die and decompose
		Applied as liquid or granules during early growth phase	Monocots, such as pondweeds (e.g. CLP) and many other native species not affected	May kill native dicots such as pond lilies and other submerged species (e.g. coontail)
			Can be selective depending on concentration and seasonal timing	Cannot be used in combination with copper herbicides (used for algae)
			Can be used in synergy with endotholl for early season CLP and EWM treatments	Toxic to fish
			Widely used aquatic herbicide	

			Management Options for Aquatic Plants			
					Draft updated Oct 2006	
	Option	Permit Needed?	How it Works	PROS	CONS	
b.	Endothall	Y	Broad-spectrum ³ , contact ⁴ herbicide that inhibits protein synthesis	Especially effective on CLP and also effective on EWM	Kills many native pondweeds	
			Applied as liquid or granules	May be effective in reducing reestablishment of CLP if reapplied several years in a row in early spring	Not as effective in dense plant beds; heavy vegetation requires multiple treatments	
				Can be selective depending on concentration and seasonal timing	Not to be used in water supplies; post- treatment restriction on irrigation	
				Can be combined with 2,4-D for early season CLP and EWM treatments, or with copper compounds	Toxic to aquatic fauna (to varying degrees)	
				Limited off-site drift		
C.	Diquat	Y	Broad-spectrum, contact herbicide that disrupts cellular functioning	Mostly used for water-milfoil and duckweed	May impact non-target plants, especially native pondweeds, coontail, elodea, naiads	
			Applied as liquid, can be combined with copper treatment	Rapid action	Toxic to aquatic invertebrates	
				Limited direct toxicity on fish and other animals	Must be reapplied several years in a row	
					Ineffective in muddy or cold water (<50°F)	
d.	Fluridone		Broad-spectrum, systemic herbicide that inhibits photosynthesis	Effective on EWM for 1 to 4 years with aggressive follow-up treatments	Affects non-target plants, particularly native milfoils, coontails, elodea, and naiads, even at low concentrations	
			Must be applied during early growth stage	Some reduction in non-target effects can be achieved by lowering dosage	Requires long contact time at low doses: 60- 90 days	
			Available with a special permit only; chemical applications beyond 150 ft from shore not allowed under NR 107	Slow decomposition of plants may limit decreases in dissolved oxygen	Demonstrated herbicide resistance in hydrilla subjected to repeat treatments	
			Applied at very low concentration at whole lake scale	Low toxicity to aquatic animals	In shallow eutrophic systems, may result in decreased water clarity	
					Unknown effect of repeat whole-lake treatments on lake ecology	

Management Options for Aquatic Plants

					Draft updated Oct 2006	
	Option	Permit Needed?	How it Works	PROS	CONS	
e.	Glyphosate	Y	Broad-spectrum, systemic herbicide that disrupts enzyme formation and function	Effective on floating and emergent plants such as purple loosestrife	RoundUp is often incorrectly substituted for Rodeo - Associated surfactants of RoundUp believed to be toxic to reptiles and amphibians	
			Usually used for purple loosestrife stems or cattails	Selective if carefully applied to individual plants	Cannot be used near potable water intakes	
			Applied as liquid spray or painted on loosetrife stems	Non-toxic to most aquatic animals at recommended dosages	Ineffective in muddy water	
				Effective control for 1-5 years	No control of submerged plants	
f.	Triclopyr	Y	Systemic herbicide selective to broadleaf plants that disrupts enzyme function	Effective on many emergent and floating plants	Impacts may occur to some native plants at higher doses (e.g. coontail)	
			Applied as liquid spray or liquid	More effective on dicots, such as purple loosestrife; may be more effective than glyphosate	May be toxic to sensitive invertebrates at higher concentrations	
				Control of target plants occurs in 3-5 weeks	Retreatment opportunities may be limited due to maximum seasonal rate (2.5 ppm)	
				Low toxicity to aquatic animals	Sensitive to UV light; sunlight can break herbicide down prematurely	
				No recreational use restrictions following treatment	Relatively new management option for aquatic plants (since 2003)	
g.	Copper compounds	Y	Broad-spectrum, systemic herbicide that prevents photosynthesis	Reduces algal growth and increases water clarity	Elemental copper accumulates and persists in sediments	
			Used to control planktonic and filamentous algae	No recreational or agricultural restrictions on water use following treatment	Short-term results	
			Wisconsin allows small-scale control only	Herbicidal action on hydrilla, an invasive plant not yet present in Wisconsin	Long-term effects of repeat treatments to benthic organisms unknown	
					Toxic to invertebrates, trout and other fish, depending on the hardness of the water	
					Clear water may increase plant growth	
-			t and moved to the site of action. Often slowe o groups of plants, Aquatic dicots include wate	r-acting than contact herbicides. rlilies, bladderworts, watermilfoils, and coontails.		
0	oad-spectrum herbicide - Affe					
			t; kills only plant tissue it contacts directly.
